

Tasks completed last week:

1. Completed the reading of the event survey, modified the expression of some sentences, and unified the repeated reference and format (deleted unimportant parts of the reference, such as pages, volume, number)
2. Added denoising&SR-related visualization results and tables for comparison of various methods to the supplementary material section in the event survey.
3. Read the event survey again, and checked it for plagiarism rate.
4. Re-read RGB-T, and feel that it can be optimized according to the expression of the two strategies, and found that there are many repeated expressions in the article, which will lead to fewer technical ideas in this article, and the motivation and results of each strategy expression is insufficient.
5. I am sorting out the reading notes of 'Continual Test-Time Domain Adaptation'.
